ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings (Note 1)

Parameter	Symbol	Value	Unit
Power Supply Voltage	V_{CC}	32	V
Differential Input Voltage	V_{ID}	32	V
Input Voltage	V_{IC}	-0.3 to 32	V
Input Current ($V_{IN} < -0.3V$) (Note 2)	I_{IN}	50	mA
Output Short Circuit to Ground (One Amplifier) (Note 3) $V_{CC} \leq 15V$ and $T_A = 25^\circ C$		Continuous	
Power Dissipation ($T_A = 25^\circ C$)	P_D	550	mW
Operating Junction Temperature	T_J	0 to 70	$^\circ C$
Storage Temperature Range	T_{STG}	-65 to 150	$^\circ C$
Lead Temperature (Soldering, 10 Seconds)	T_{LEAD}	260	$^\circ C$

Note 1: Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device under these conditions is not implied. Exposure to "Absolute Maximum Ratings" for extended periods may affect device reliability.

Note 2: This input current will only exist when the voltage at any of the input leads is driven negative. It is due to the collector-base junction of the input PNP transistors becoming forward biased and thereby acting as input diode clamps. In addition to this diode action, there is also lateral NPN parasitic transistor action on the IC chip. This transistor action can cause the output voltages of the op amps to go to the V_{CC} voltage level (or to ground for a large overdrive) for the time duration that an input is driven negative. This is not destructive and normal output states will re-establish when the input voltage, which was negative, again returns to a value greater than -0.3V (at $25^\circ C$)

Note 3: Short circuits from the output to V_{CC} can cause excessive heating and eventual destruction. When considering short circuits to ground, the maximum output current is approximately 40mA independent of the magnitude of V_{CC} . At values of supply voltage in excess of +15V, continuous short circuits can exceed the power dissipation ratings and cause eventual destruction. Destructive dissipation can result from simultaneous shorts on all amplifiers.

Thermal Resistance (Junction to Case)	θ_{JC}			98.84		$^{\circ}C/W$	

Note 4: The direction of the input current is out of the IC due to the PNP input stage. This current is essentially constant, independent of the state of the output so no loading change exists on the input lines.

Note 5: The input common-mode voltage of either input signal voltage should not be allowed to go negatively by more than 0.3V (at 25°C). The upper end of the common-mode voltage range is $V_{CC}-1.5V$ (at 25°C), but either or both inputs can go to +32V without damages, independent of the magnitude of the V_{CC} .

Note 6: Due to proximity of external components, insure that coupling is not originating via stray capacitors between these external parts. This typically can be detected as this type of capacitance increases at higher frequencies.
